

Monthly Crime Trends

The graphs in this section provide monthly data for selected offence categories from July, 1998 (1998/99 financial year) to June, 2008 (2007/08 financial year), expressed as a rate, thereby factoring in the size of the Queensland population for each year. All crime statistics appearing in these graphs are comparable over the ten year period except where indicated with a break in continuity.

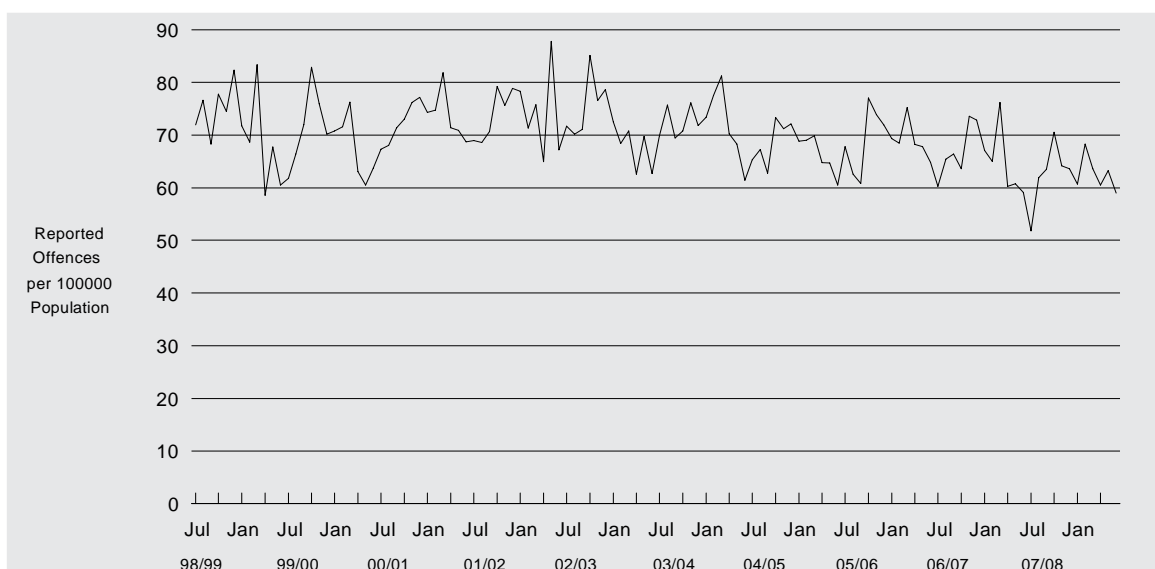

Quarterly Estimated Residential Population (ERP) statistics for Queensland provided by the Australian Bureau of Statistics (Catalogue 3101.0) were used to calculate the rates up to June, 2008.

To test for a statistically significant trend in the following graphs, Kendall's rank order correlation test (Conover, W.). 1971 *Practical Non-Parametric*

Statistics, 2nd edition, John Wiley and Sons, pages 256-260) was used. Although the 5% level of significance was used, most results were significant at the 1% level. Details are footnoted where appropriate in the text under each graph. This test is a two-tailed test which determines whether there is an increasing or decreasing trend in the recorded number of offences over the one hundred and twenty month period covered in the report.

Some month to month variations in the numbers of recorded offences suggested seasonal factors may be operating. The test for trend is not sensitive to seasonal variations; it is sensitive only to a generally increasing or decreasing trend over the time period examined.

Offences Against the Person

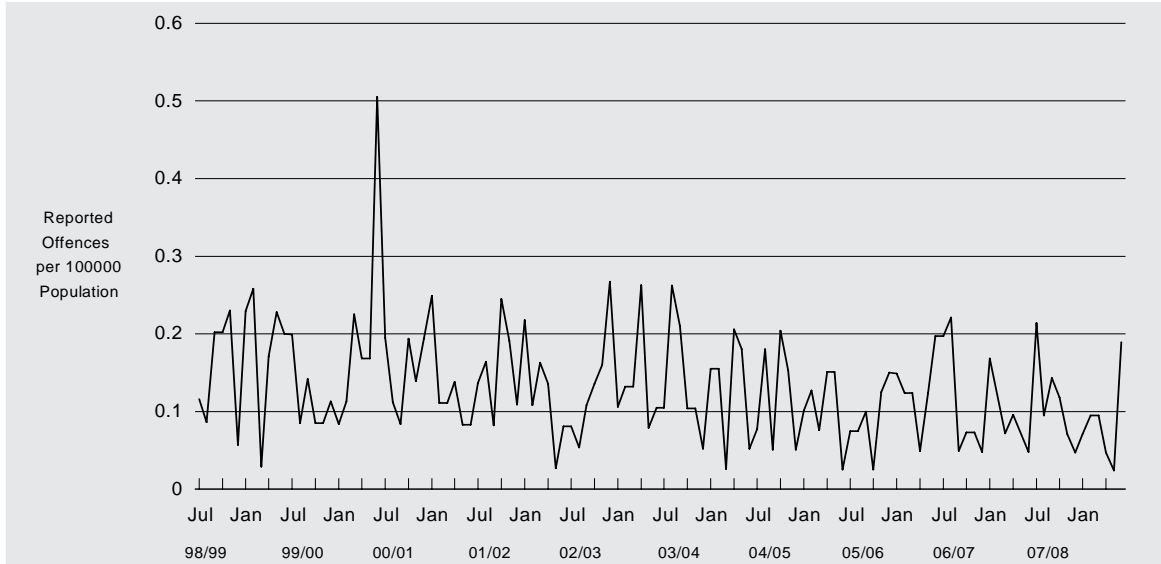

Total Offences Against the Person has a statistically significant* decreasing trend over the ten year period. This broad offence group tends to be dominated by Assaults as is evidenced by the strong seasonal

influence exhibited by the time series. During the last financial year, Offences Against the Person peaked in October possibly due to the high number of Sexual Offences reported in the month.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See above for further information.

Monthly Crime Trends

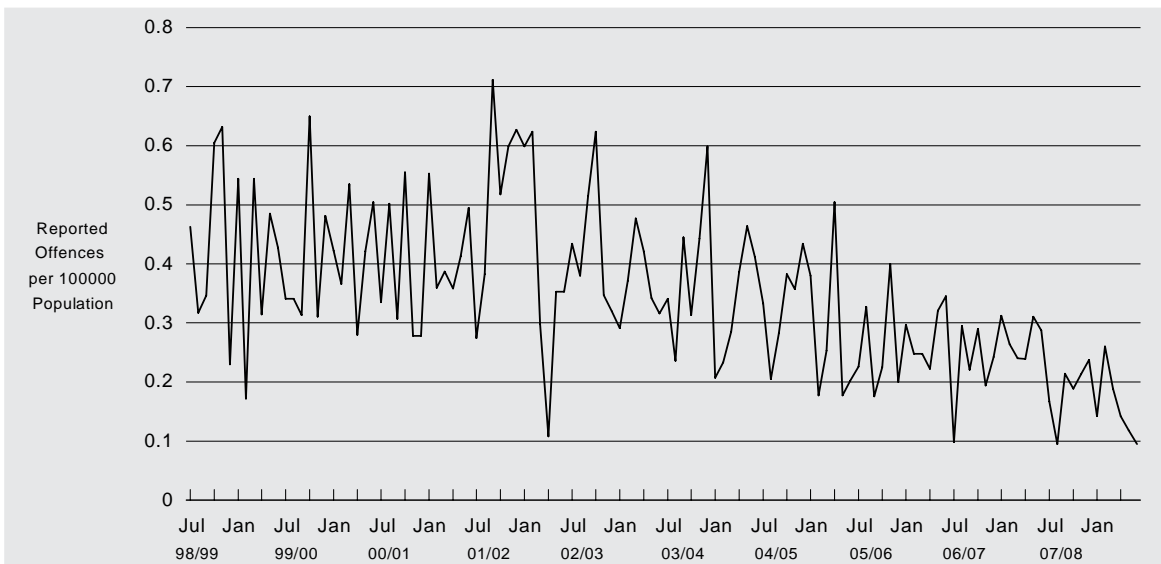

Homicide (Murder)

Over the ten year period there is a significantly decreasing trend* in the Homicide (Murder) time series. This small volume offence is subject to marked fluctuations from one month to the next. The spike in

the time series occurred in June 2000 and was the result of the Childers Backpacker fire in which there were fifteen victims. There were 51 reported murders in Queensland for the second consecutive year.

Other Homicide

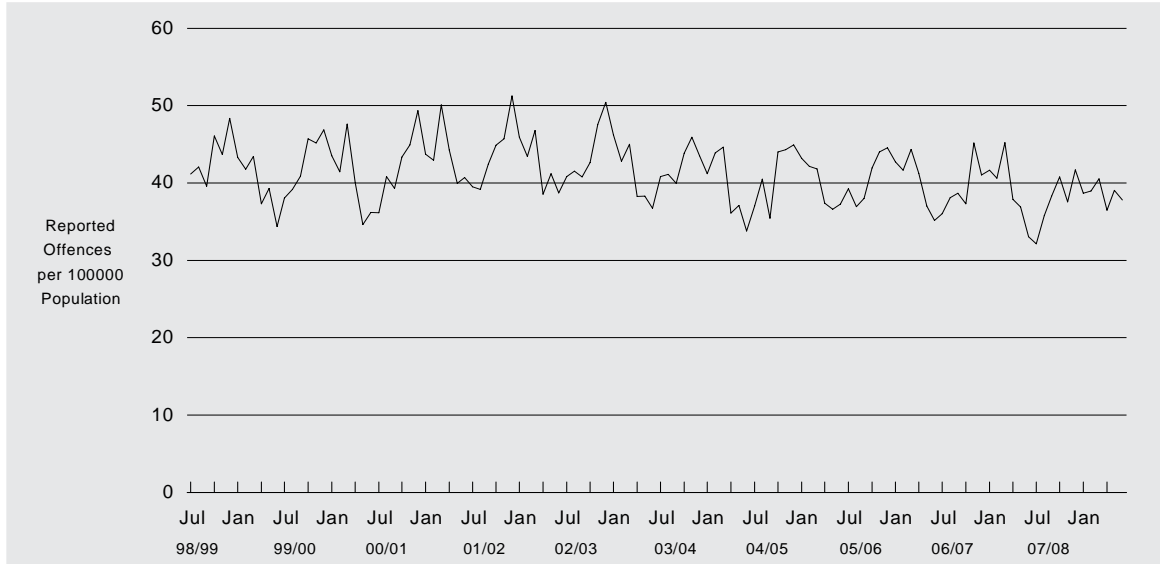

As with Homicide (Murder), Other Homicide is a low volume offence category and, as such, is subject to random fluctuations from month to month. Over the ten year period, there is a significantly decreasing

trend* for the Other Homicide time series. A substantial decrease of 31% reported in the 2007/08 financial year contributed to the decreasing trend displayed in the Other Homicide time series.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

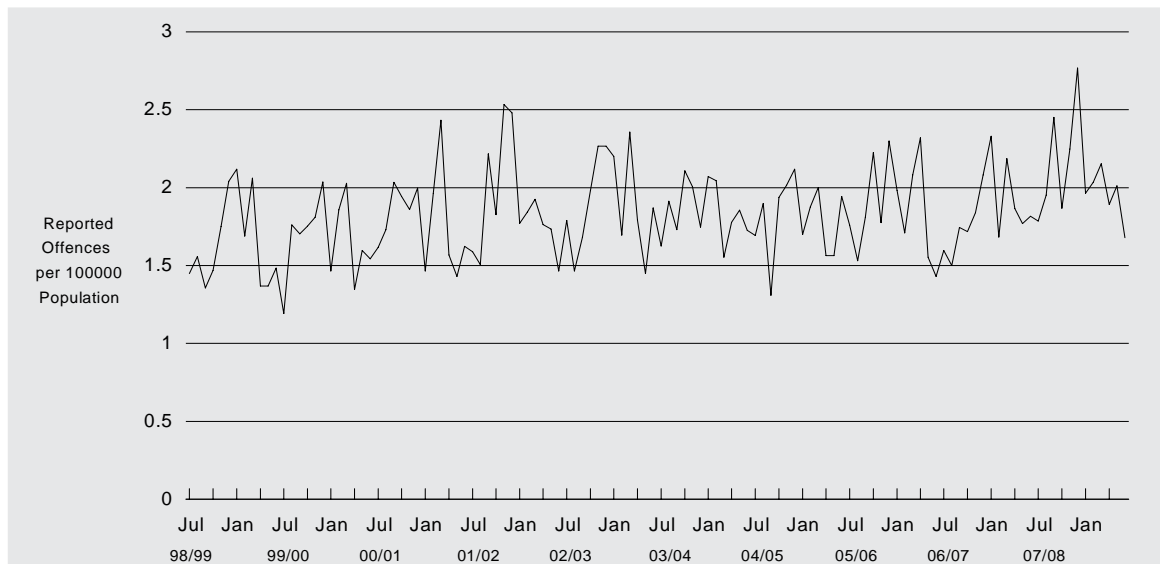

Assault

Assault is the largest in volume of the Offences Against the Person categories. There was a statistically significant decreasing trend* detected. Assault offences are subject to strong seasonal influences,

which are evident in the time series, with a higher rate of offences occurring over the summer months and a lower number of offences occurring in the winter months.

Grievous Assault

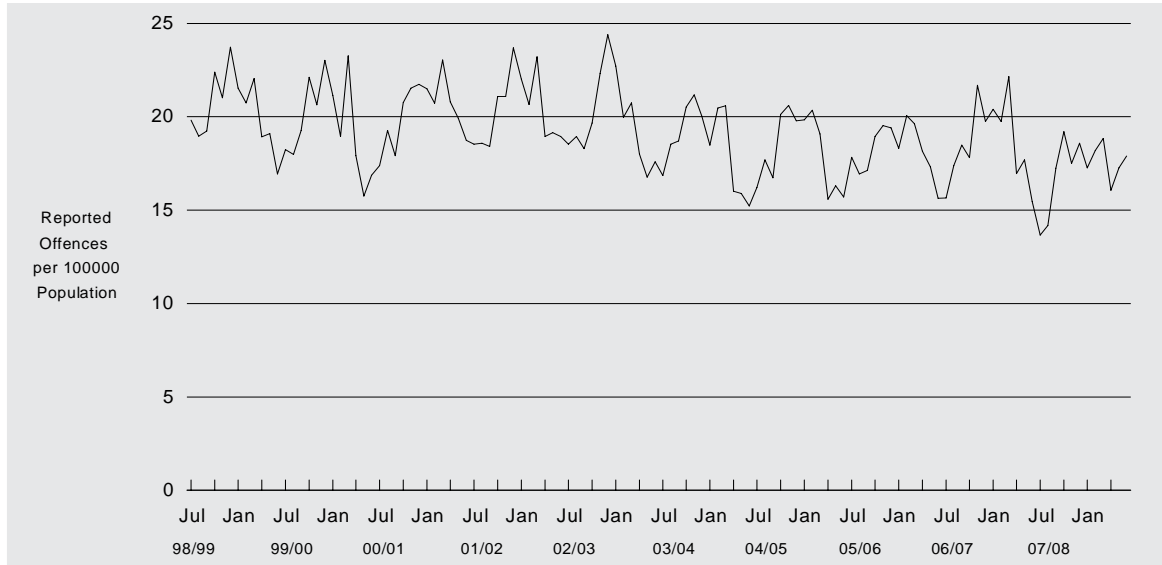

Grievous Assault is a small volume offence and, as such, will be subject to marked fluctuations over time. Overall, the rate of Grievous Assaults has increased*

slightly. The seasonal influence is obvious in the time series with the peaks occurring in the summer months.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

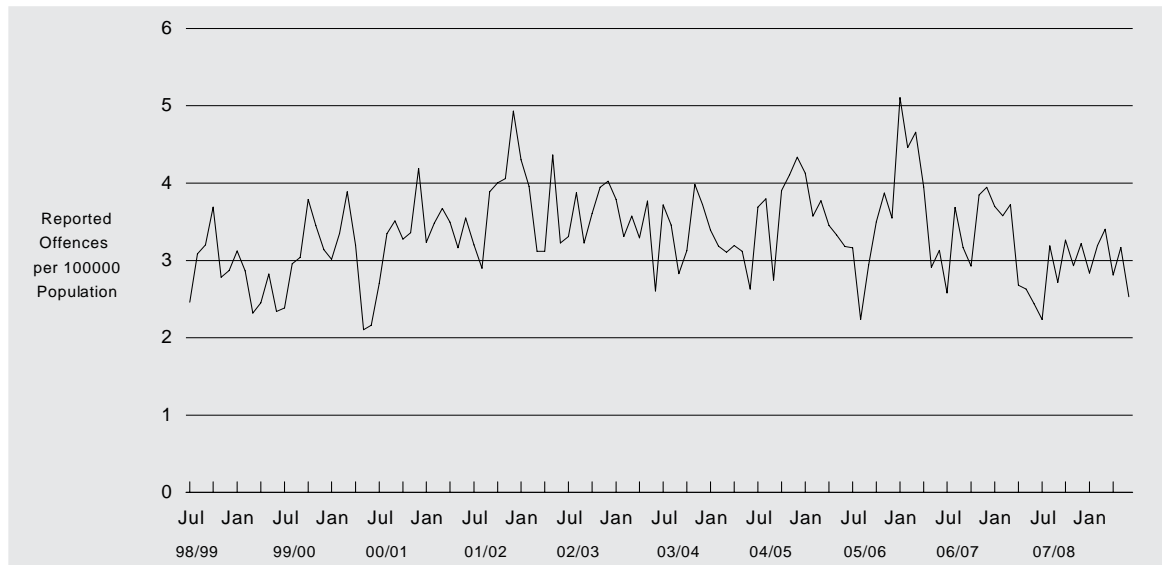

Serious Assault

Again, the strong seasonal influences are evident in this time series, with a higher rate of offences occurring over the summer months and a lower rate of

offences occurring in the winter months of each year. A significantly decreasing trend was detected over the ten year period*.

Serious Assault (Other)

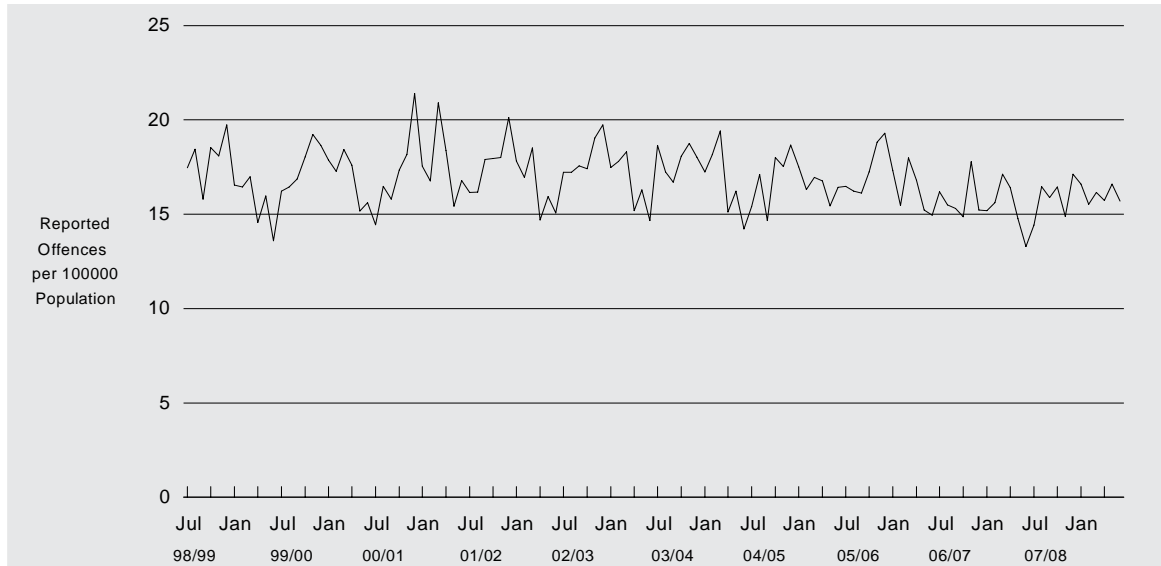

Serious Assault (Other) has no statistically significant increasing or decreasing trend* over the ten year period. Although less apparent than for the other sub-

categories of Assault, the peaks and troughs reflect the strong seasonal influence exerted on the time series with the higher rates occurring in the summer months.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

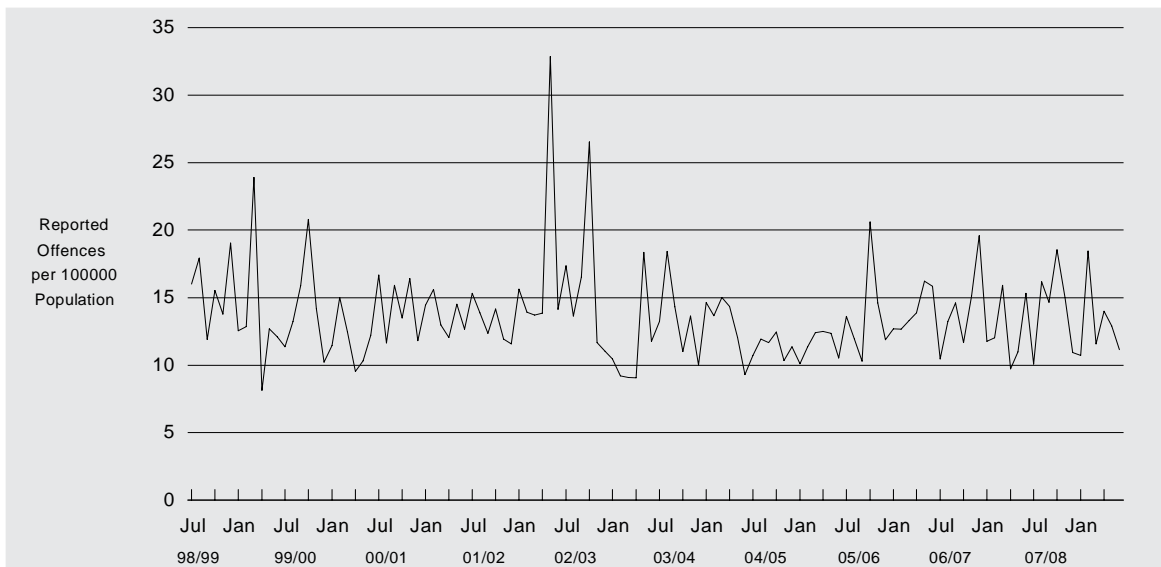

Common Assault

The stability in the trend of Common Assault offences continues into 2007/08. There is a statistically significant decreasing trend*. As with all sub-categories

of Assault, the seasonal influence is apparent in the graph above.

Sexual Offences

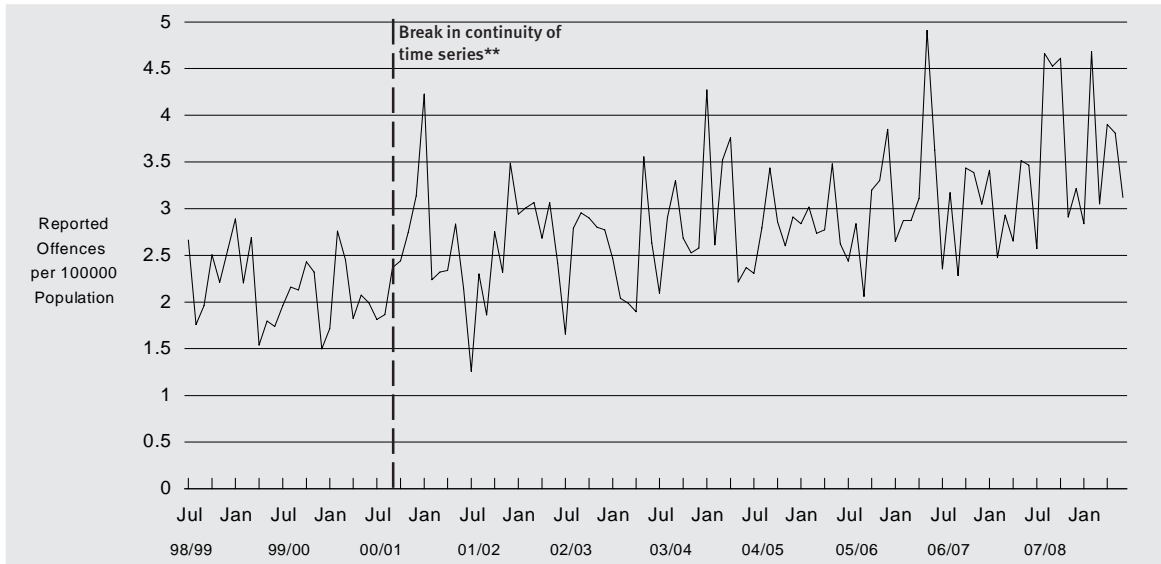

The spikes in the Sexual Offences time series are the result of large numbers of offences being reported to police. All are due to single offenders who were

responsible for multiple offences for incidents occurring over a number of years. Overall, this time series exhibits no significant trend*.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

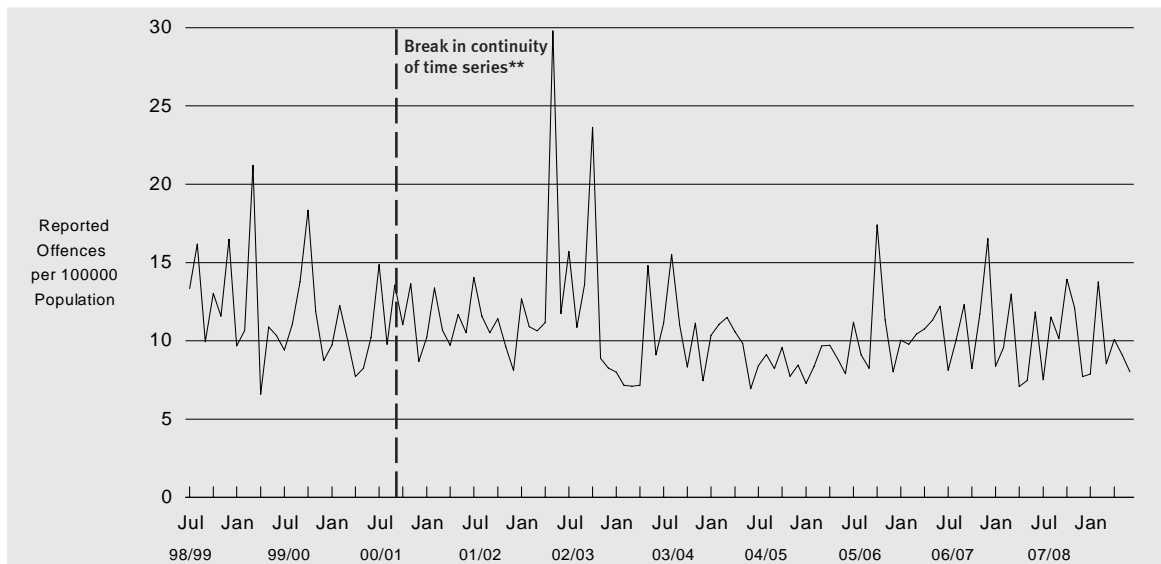

Rape and Attempted Rape

The break in continuity of the Rape and Attempted Rape time series involved a broadening of the definition of rape (*Criminal Law Amendment Act, 1997*; changes to the Criminal Code, 2000)**. As such, care should be exercised when comparing data prior to and following

these changes as is illustrated by the marked increase in offences following the break in continuity. These increases have resulted in a statistically significant upward trend* detected overall.

Other Sexual Offences

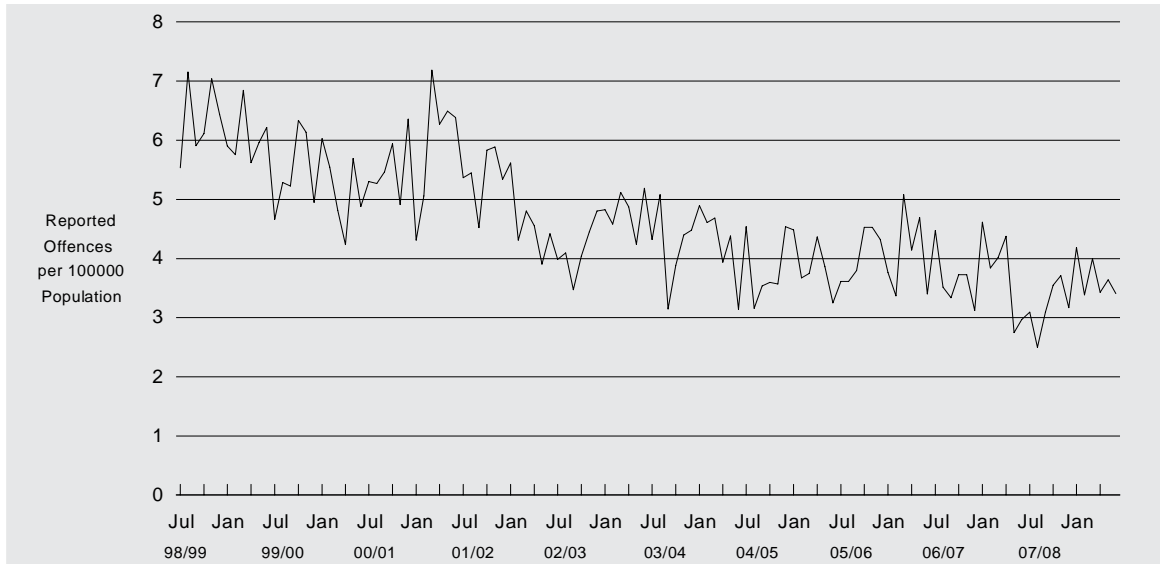

Single offenders were charged with in excess of 660 and 400 Other Sexual Offences for incidents which occurred over a period of time. The charges were preferred in May and October 2002 respectively resulting in the

third and fourth large spikes in the time series. Two reports relating to historical offences with large counts were responsible for the spike in December 2006.

** The introduction of the *Criminal Law Amendment Act, 1997* resulted in a broadening of the definition of Rape and Attempted Rape and a narrowing of Other Sexual Offences; further changes to the Criminal Code (October, 2000) resulted in an even broader definition of Rape and Attempted Rape and a subsequent narrowing of Other Sexual Offences.
* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

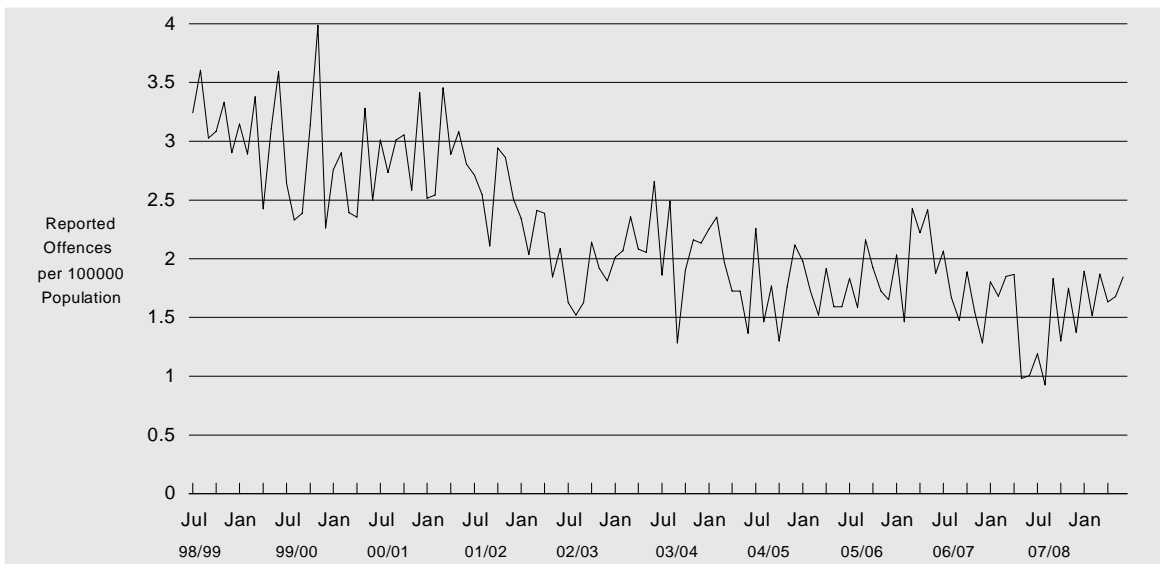

Robbery

Rates of Robbery offences decreased markedly from July 1998 to mid 2000 and then again from early 2001 to 2002. Since 2003, rates of Robbery offences have

continued to decrease. As a result of the recent decreases across the time series, overall there was a significantly* downward trend detected.

Armed Robbery

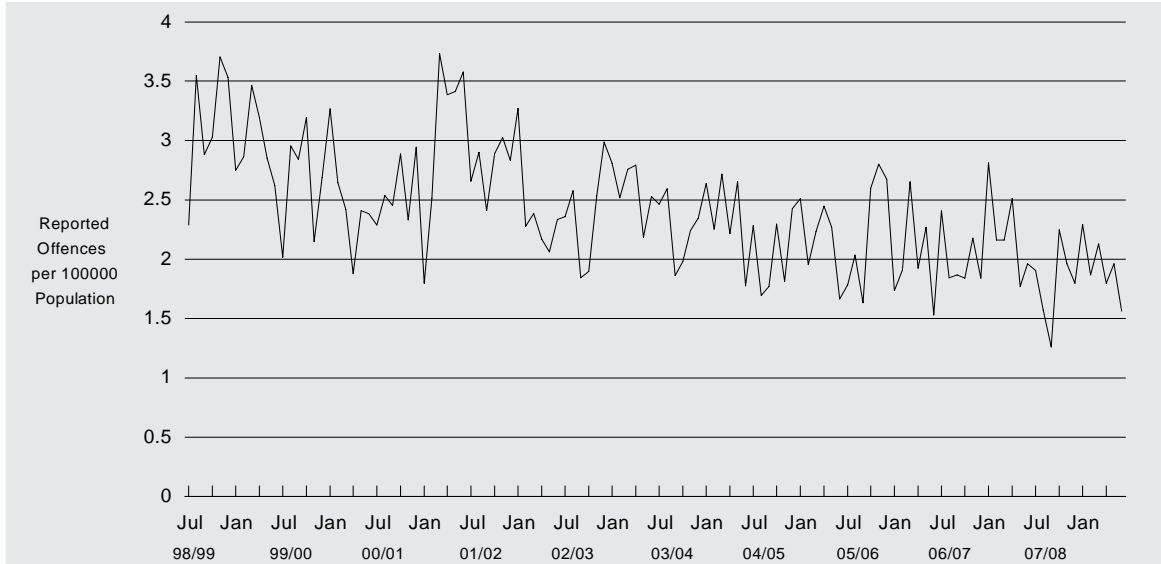

Again, the recent decreases in the rate of Armed Robbery over the past seven years are apparent in the time series above. Overall, there was a statistically significant* downward trend detected. After recording

an increase in 2005/06 for the first time in four years, Armed Robbery continues to record decreases (19% in 2006/07 and a further 2% in the current period under review).

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

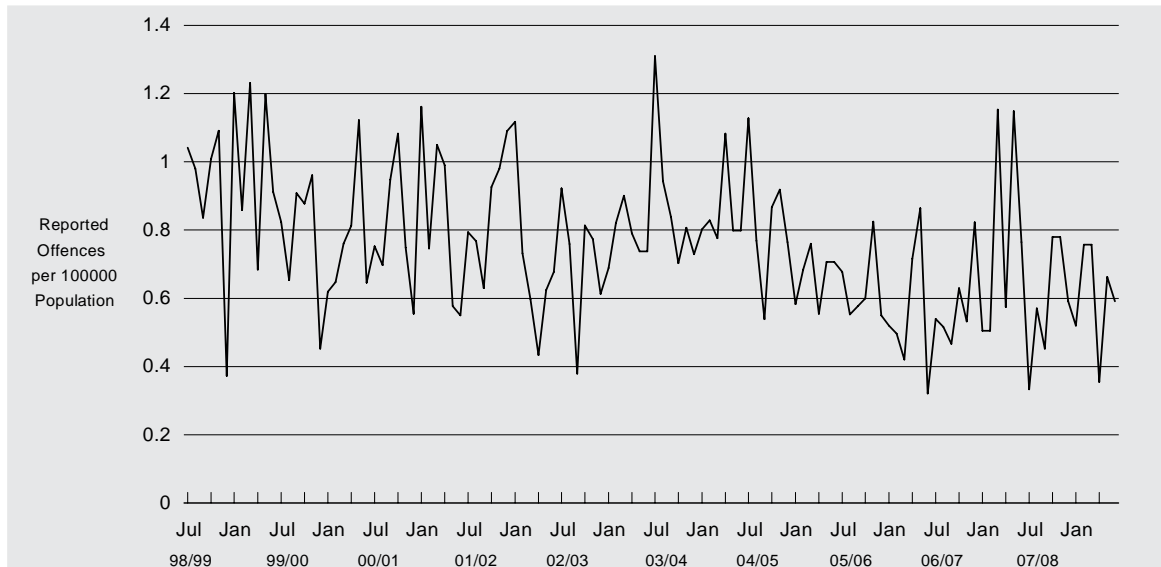

Unarmed Robbery

Rates of Unarmed Robbery have recorded fluctuations over time. Since recording a peak in 2000/01 the rate of Unarmed Robbery has continued to record an overall

downward trend*. During the current period, Unarmed Robbery recorded a decrease of 12%.

Kidnapping, Abduction, etc.

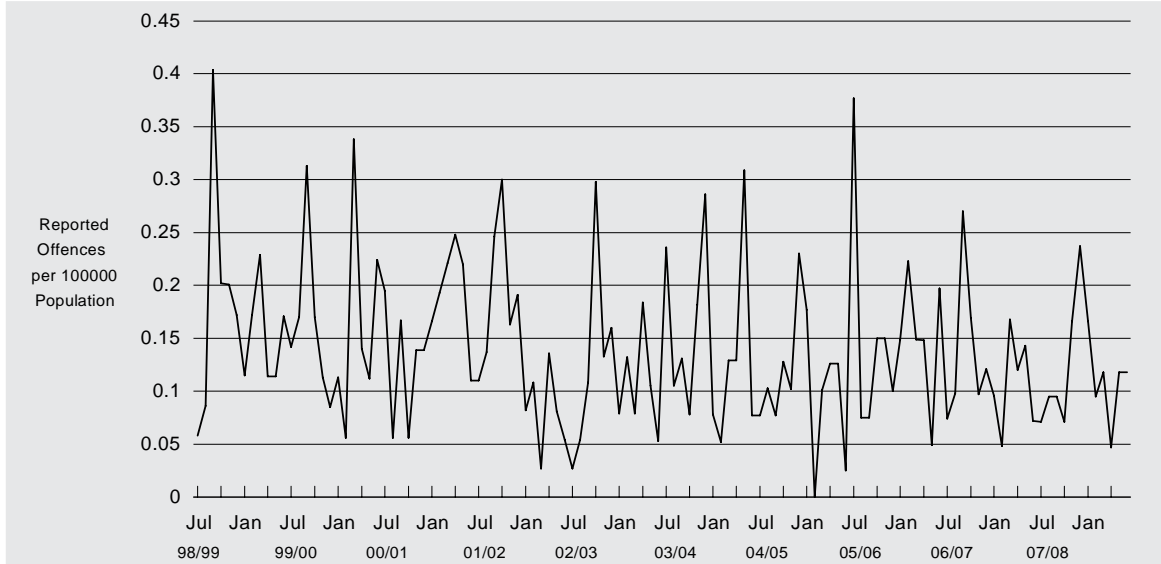

This time series is subject to the fluctuations that occur in small volume offence categories. The rates of Kidnapping and Abduction etc. offences have been steadily decreasing over the ten year period of the time

series and exhibits a statistically significant decreasing trend*. The spikes in March and June 2007 are the result of reported historical offences that occurred between 1968 and 1971.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

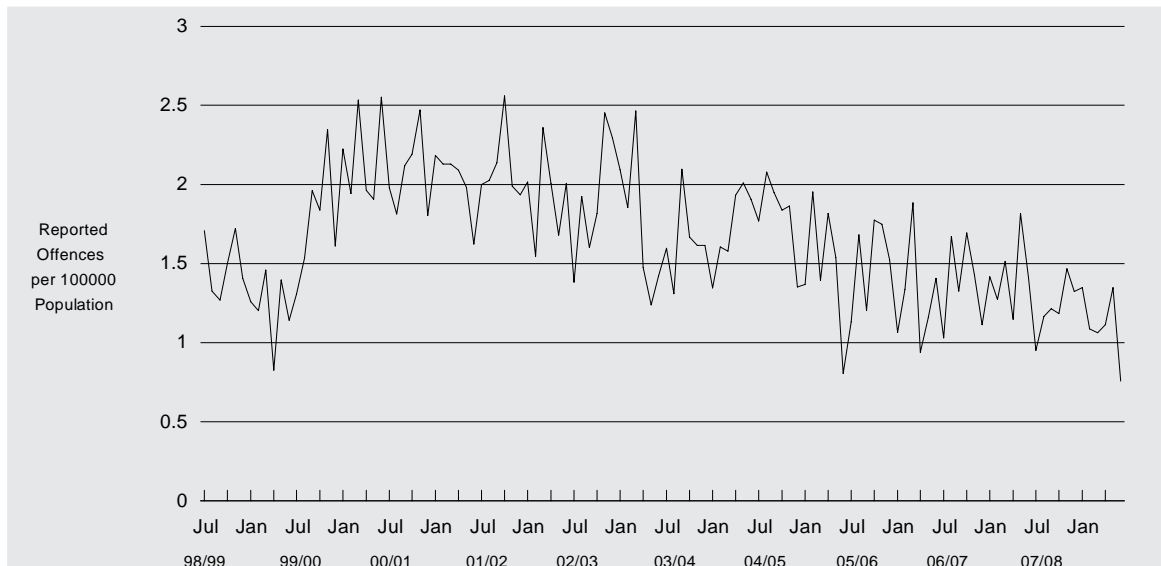

Extortion

Extortion is the lowest in volume of the Offences Against the Person categories and, as such, is prone to random variations from month to month. Overall, no

statistically significant increasing or decreasing* trend was detected over the ten year period. During the current period, the State recorded a decrease of 5%.

Stalking

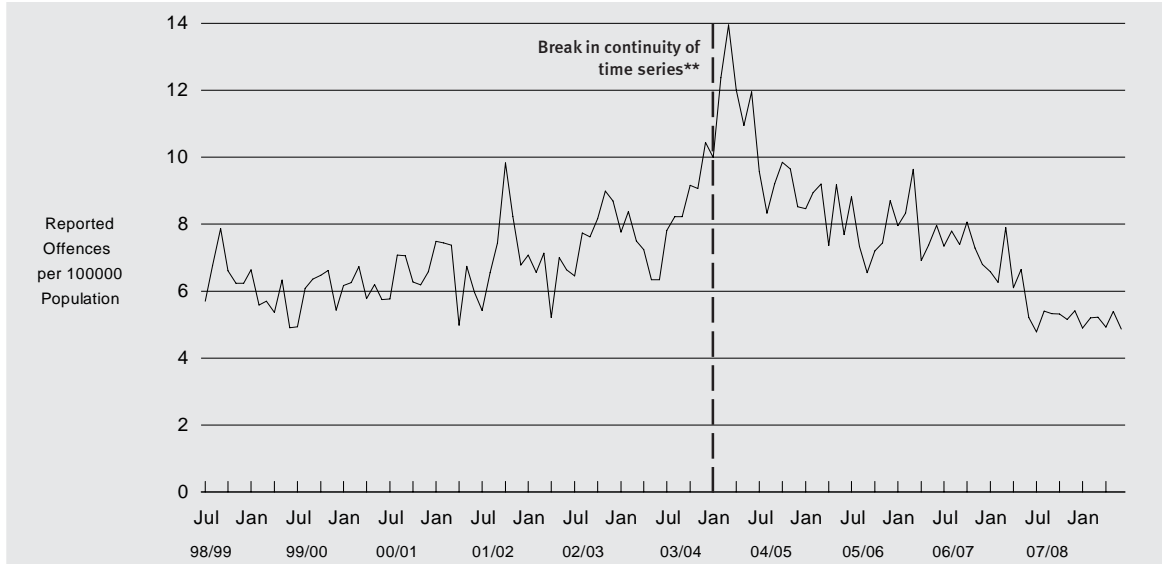

Stalking has been reported separately for the first time in the current publication. As can be seen in the graph above, the time series displays a statistically significant

decreasing trend* over the ten year period. The State recorded a 17% decrease in Stalking offences during the 2007/08 financial year.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

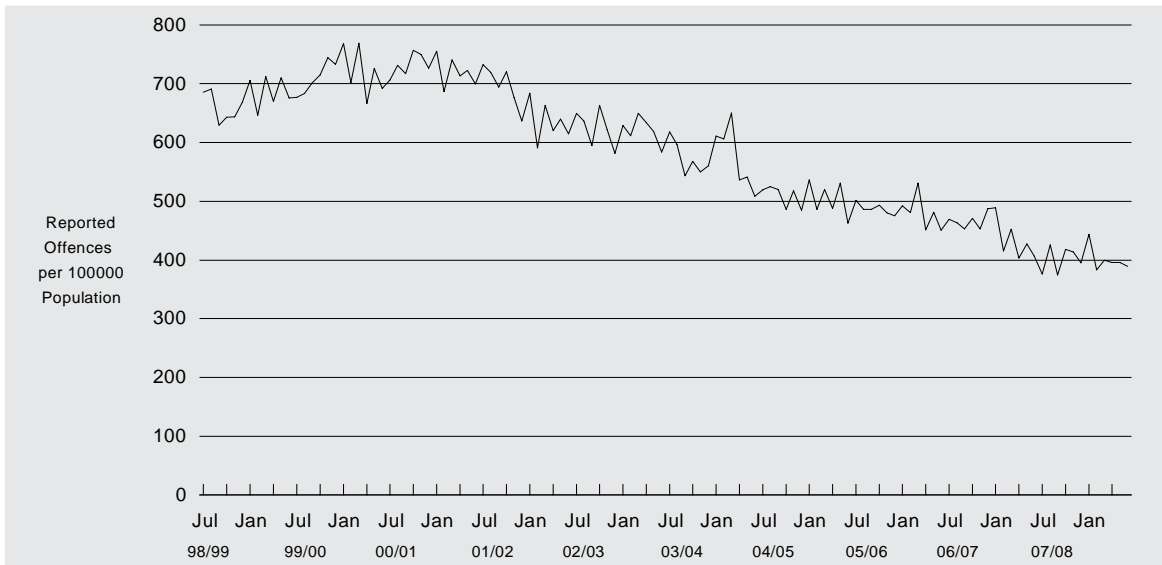

Life Endangering Acts

Life Endangering Acts has been reported separately for the first time in the current publication. Due to a review conducted in January 2004 by the CMC, the recording of child abuse cases has undergone changes**. The rates

of Life Endangering Acts offences have been steadily decreasing since April 2004 and exhibits no statistically significant decreasing or increasing trend* over the ten year period.

Offences Against Property

The Offences Against Property time series has historically been reasonably stable, though since January 2001, has a statistically significant downward trend* being detected. This is a large volume offence group and, as such, increases or decreases are usually

small in the overall context. The rate of Offences Against Property has decreased over the last seven years. In the current time period, Offences Against Property decreased by 11%.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

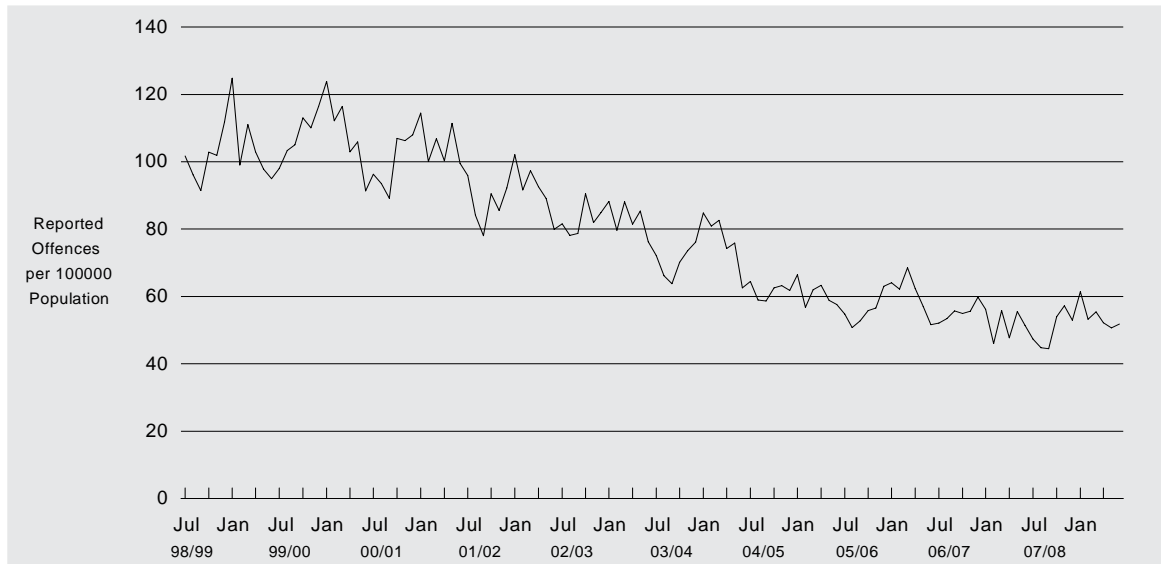

Unlawful Entry with Intent

Overall, there was a statistically significant decreasing trend detected* for Unlawful Entry with Intent. In the current period, the rate of Unlawful Entry with Intent

offences decreased by 8% following on from a decrease of 6% in the 2006/07 financial year.

Unlawful Entry - Dwellings

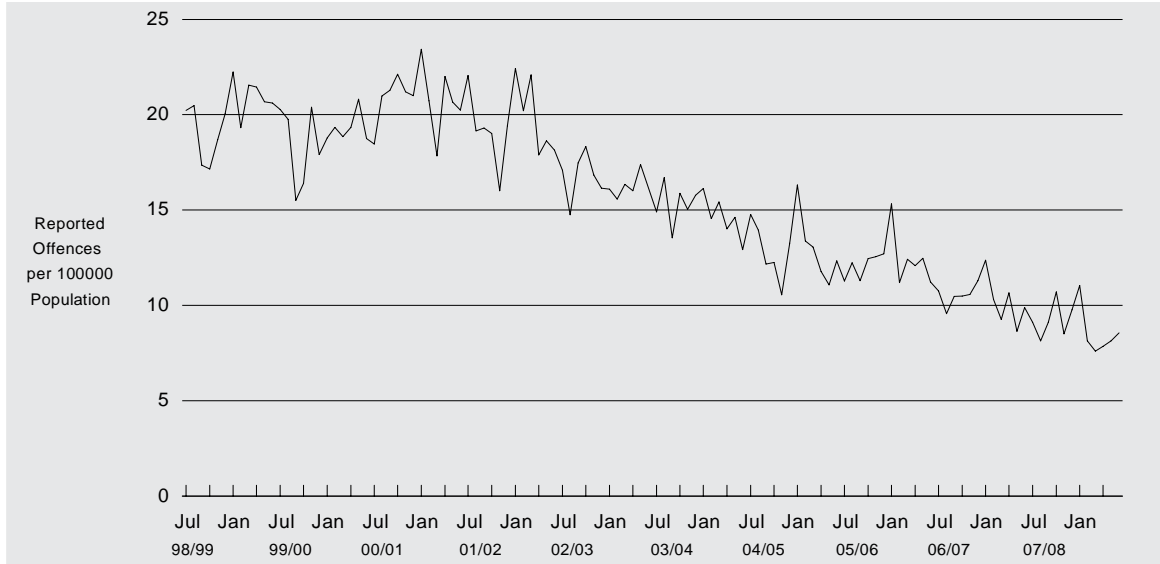

The rate of Unlawful Entry - Dwellings stabilised from 1998 to 2000. Since this time, the rate has been steadily decreasing to the extent that an overall statistically significant decreasing trend* was detected.

The rate continued to decrease reflecting a 3% reduction in the current review period. The fact that this offence is subject to seasonal variation is evidenced in the graph above.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

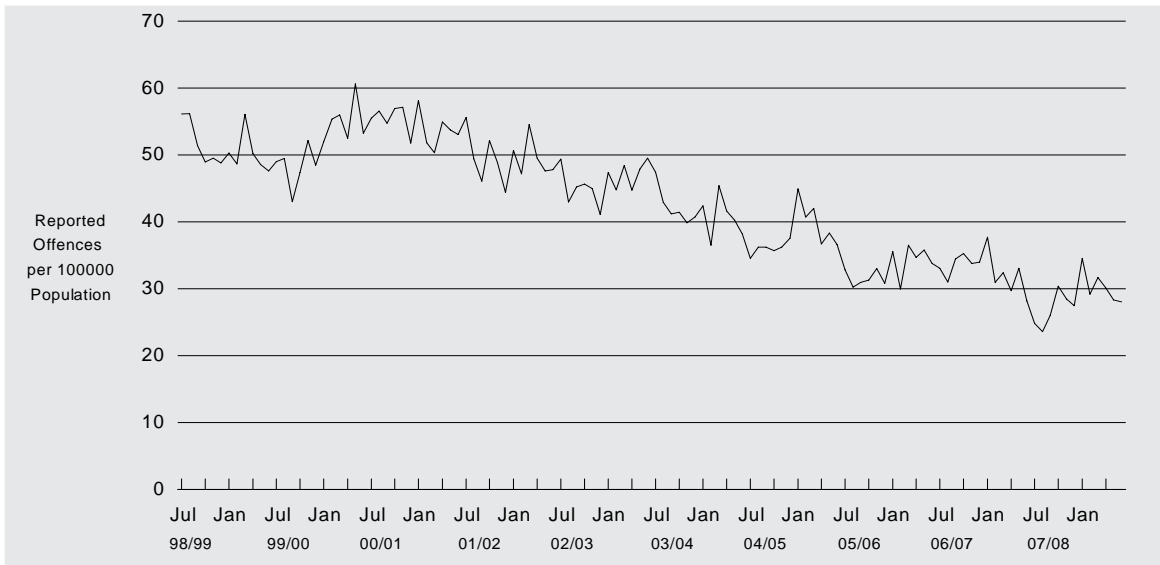

Unlawful Entry - Shops

Over the ten years, the rate of Unlawful Entry - Shops offences has been significantly decreasing*. Again, the dip towards the end of the time series is the result of the decreases seen over the last seven financial years.

2007/08 saw a decrease of 14% in Unlawful Entry - Shops offences. This follows a 15% decrease recorded in the previous year.

Unlawful Entry - Other Premises

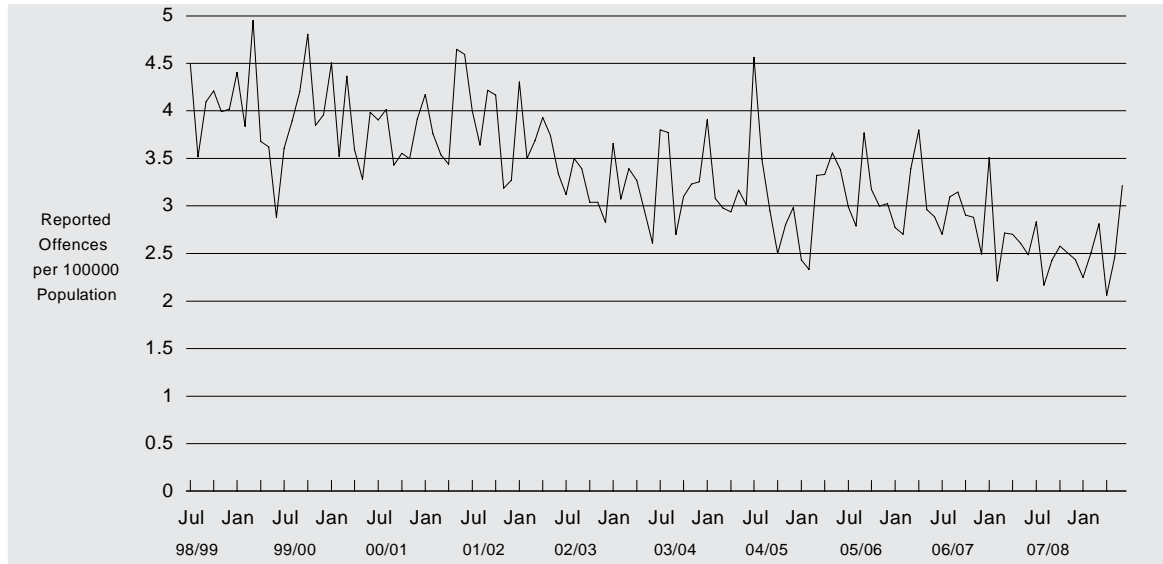

Overall, there was a significantly decreasing trend* detected for Unlawful Entry - Other Premises. Following a steady trend between 1998/99 and 2000/01, the time

series is decreasing. The reductions over the last seven financial years are apparent at the end of the time series.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

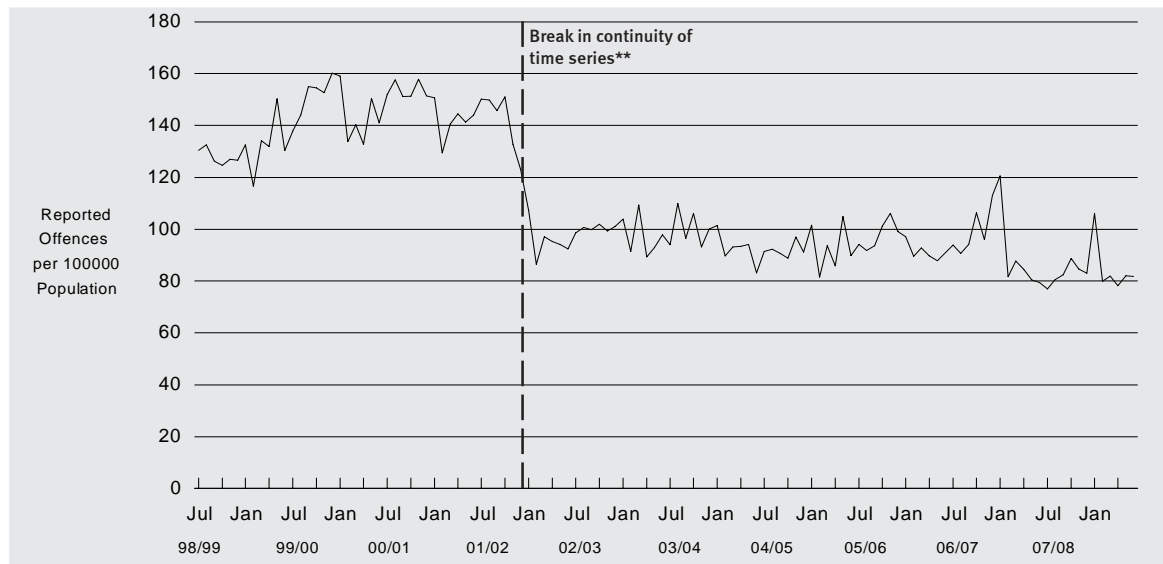

Arson

The rate of Arson offences increased in the first half of the time series but has been decreasing since. Over the ten years of the time series, a statistically significant

downward trend* was detected. For the year under review, the rate of Arson offences decreased by 10% from 33 to 30 offences per 100,000 persons.

Other Property Damage

The sharp decrease in the first half of the time series is the result of a change in policy regarding the reporting of Other Property Damage offences. This break in continuity** effectively renders a statistical test invalid.

While the change in policy contributed to a 20% decrease in the rate of offences in 2001/02, this downward trend continued for the next six years.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

** Change in policy regarding the recording of Property Damage offences in conjunction with Unlawful Entry and Unlawful Use of Motor Vehicles has resulted in a break in continuity and, thus, caution should be exercised when looking at offences over time (see Explanatory Notes page 150 for further information).

Monthly Crime Trends

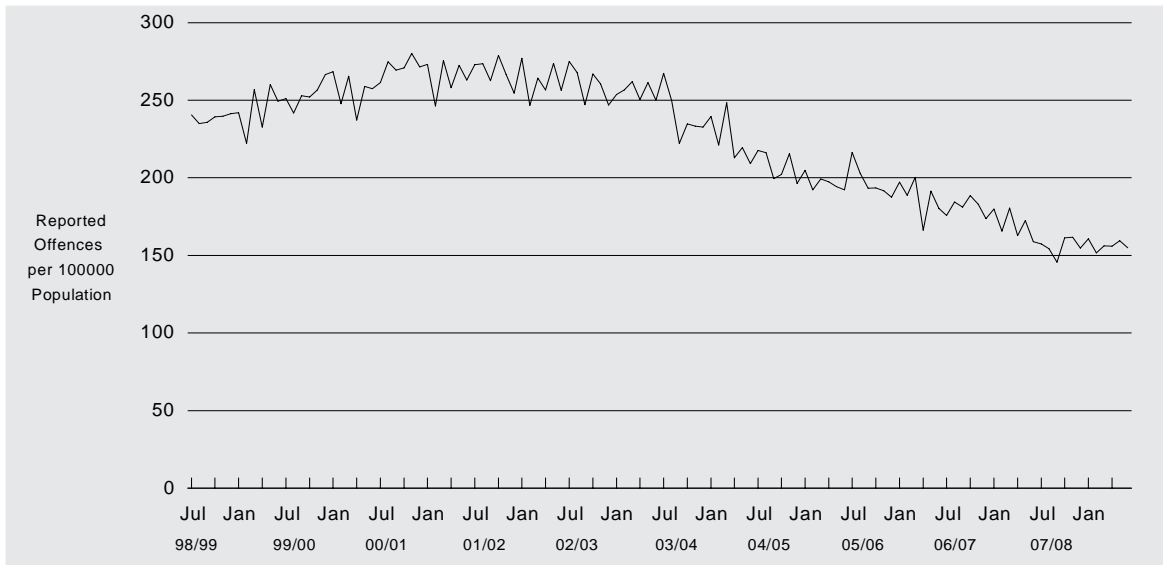

Unlawful Use of Motor Vehicle[^]

Overall, a statistically significant decreasing trend* was detected for the Unlawful Use of Motor Vehicle time series. As with other Offences Against Property, the substantive decreases recorded in the rate of Unlawful Use of Motor

Vehicle offences over the last seven financial years is apparent at the end of the time series. Following a sizeable decrease in 2006/07 of 7%, the rate of offences fell a further 13% in the current period.

Other Theft (excluding Unlawful Entry)

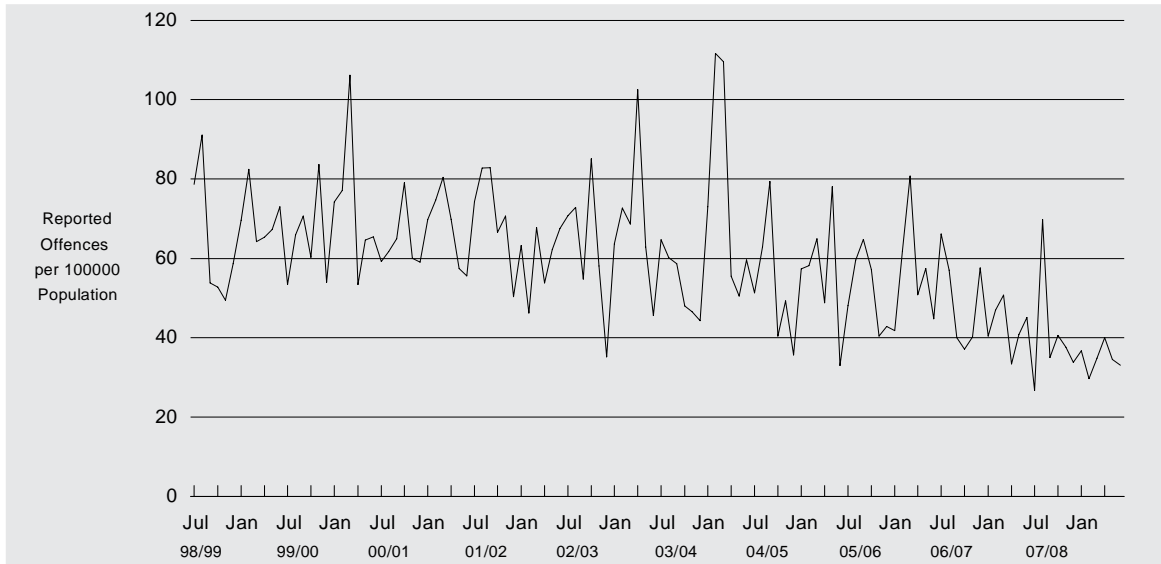

A statistically decreasing trend* was detected for the Other Theft (excluding Unlawful Entry) category. A decrease in offences can be seen since July 2003. The

current period exhibited an 11% decrease following an 8% decrease recorded during the previous period.

[^] Includes attempted offences.
 * The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

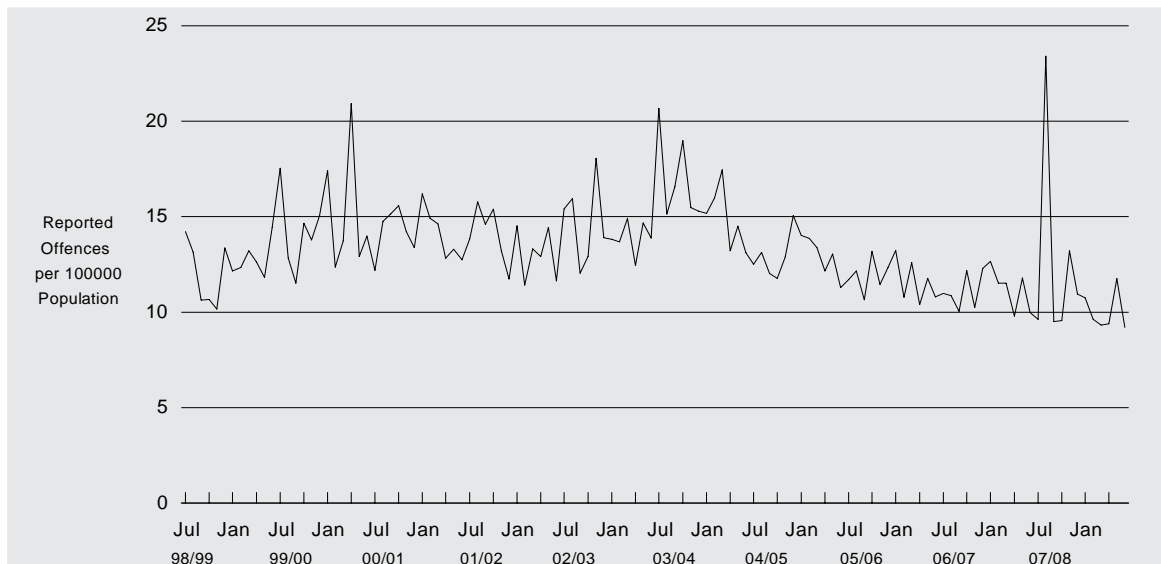

Fraud

There is a statistically significant downward trend* in Fraud offences as evident in the graph above. Four of the five sub-categories of Fraud recorded decreases

attributing to the 19% decrease in overall Fraud offences in the current reporting period.

Handling Stolen Goods

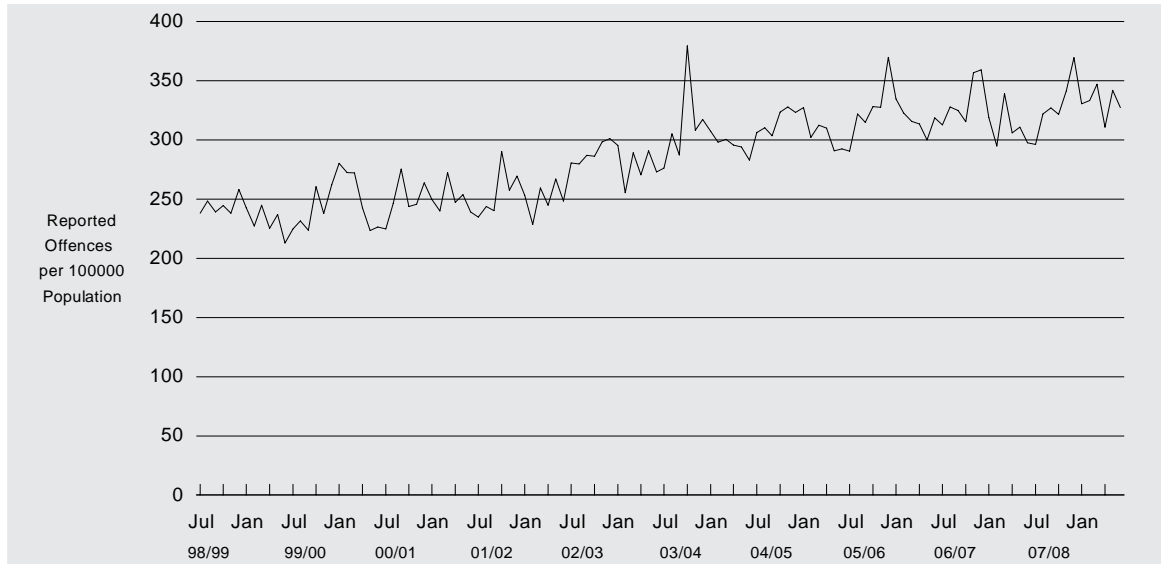

A statistically significant decreasing trend* is evident in the Handling Stolen Goods time series. Over the last 12 months, the rate of offences increased by 2% after having decreased by 5% during 2006/07. The first spike in the time series is the result of approximately

270 offences laid against two offenders in April, 2000. One offender was responsible for the spike in July 2003 being charged with 171 offences. The spike in the current period was the result of 470 offences preferred against two offenders during August 2007.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

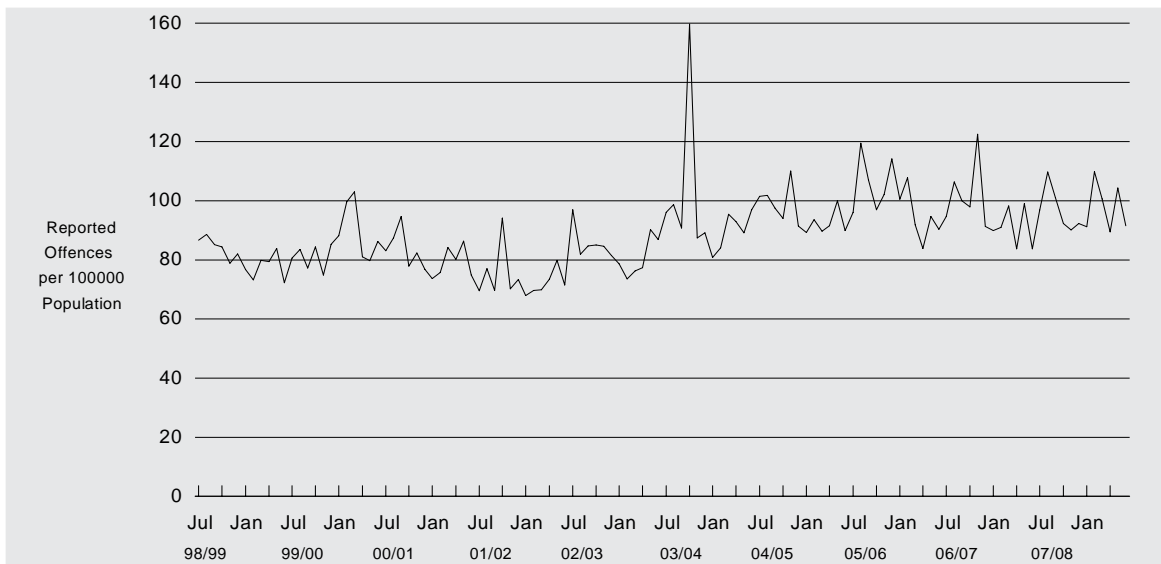

Other Offences

Other Offences are generally detected by police rather than reported to police. As such, any rise in Other Offences is usually regarded as a positive result. As is

evidenced in the graph above, a statistically significant upward trend* was detected with rates for 2007/08 continuing this trend.

Drug Offences

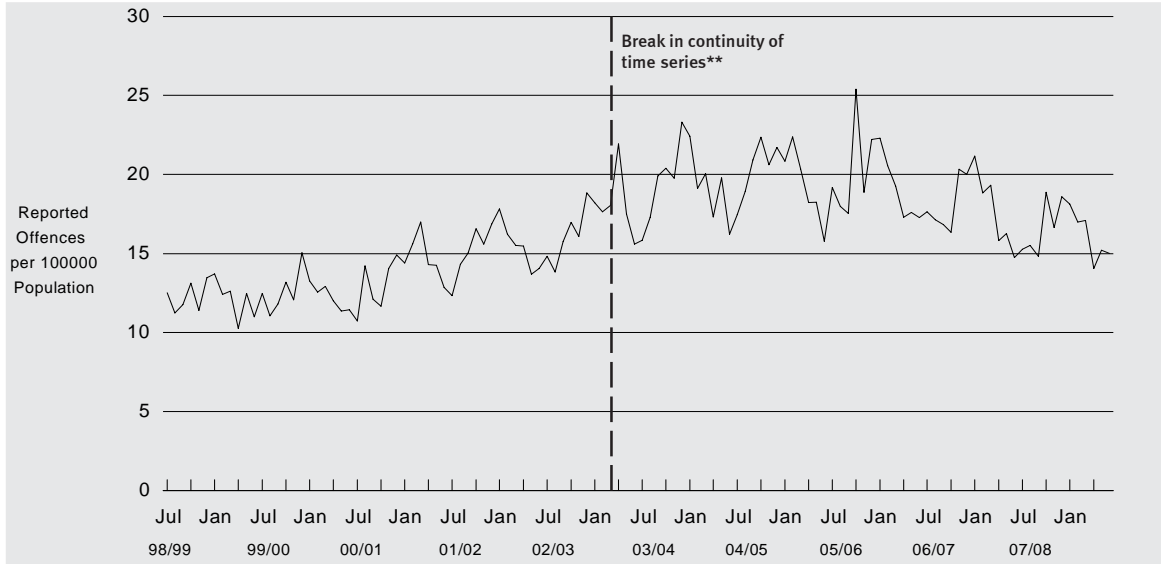

A statistically significant increasing trend* was detected for this time series over the ten year period. Following a slight decrease in the rate of Drug Offences from early 2000 to end 2001, rates again increased in 2003/04.

The spike in the middle of the time series was the result of over 2100 offences laid against a single offender in October 2003. The State recorded an increase of 1% in the current period.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

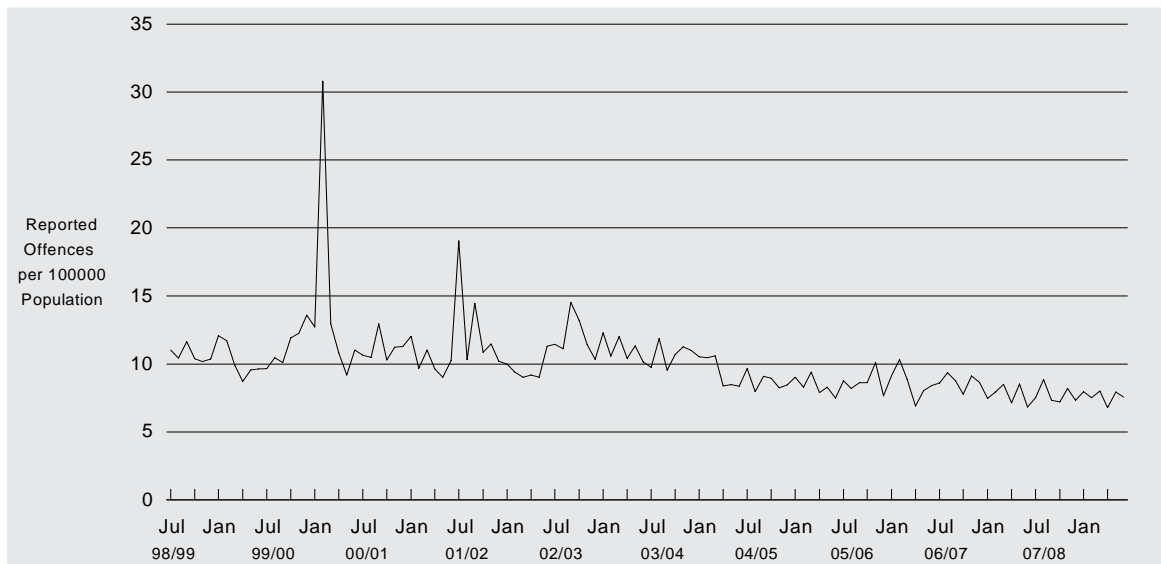

Breach of Domestic Violence Protection Orders

The legislative change in March 2003** caused a break in the continuity of this time series. Since this amendment, the time-series has stabilised. The spike near the end of the time series is the result of nearly

226 offences committed by one offender and reported to police in October 2005. Breach of Domestic Violence Protection Orders are subject to strong seasonal influences, as is evidenced in the graph above.

Weapons Act Offences

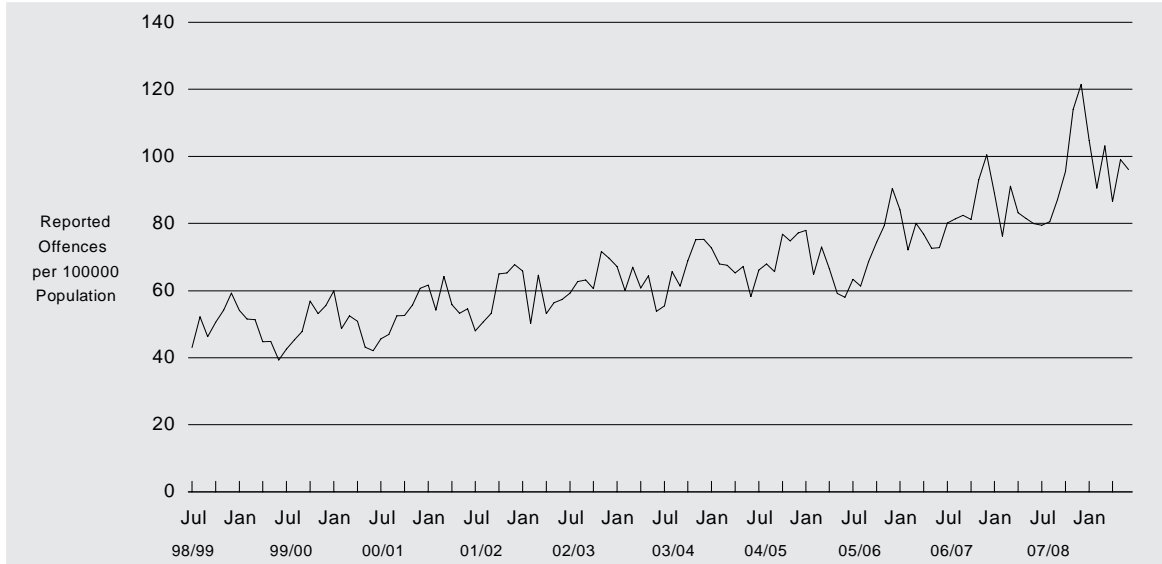

One offender was charged with 650 Weapons Act Offences in February 2000 resulting in a significant spike in the time series. Despite this spike, the time series exhibits a significantly decreasing trend*. Following the cessation of the Buy Back campaign

(September 1997), the rates increased markedly. However, since January 2003, the time series has been decreasing. The rate of offences decreased by 7% in the current period.

** The *Domestic and Family Violence Protection Act 1989* was expanded in March 2003 to include intimate personal, familial and informal care relationships.
* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.

Monthly Crime Trends

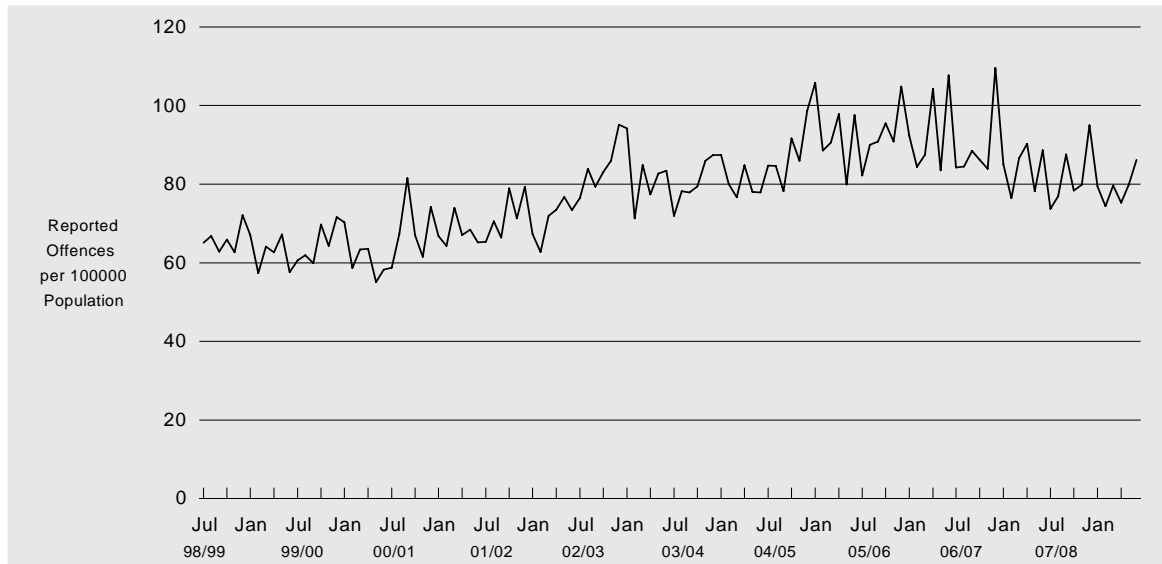

Good Order Offences

While the time series for Good Order Offences exhibits a statistically significant upward trend*, a strong seasonal influence can also be seen. Offences tend to peak in the summer months and fall to a low during the

winter months of each year. Following an increase of 13% during 2006/07, Good Order Offences increased again by a further 13% in the current period.

Traffic and Related Offences

Overall, a statistically significant increasing trend* was detected in the time series. Following increases in 2004/05 and 2005/06 of 12% and 3% respectively, the

last two time periods recorded decreases of 6% and 7% respectively.

* The result is significant at the 1% level of confidence, using Kendall's rank order correlation test. See page 17 for further information.
